Unified Butterfly Recorder

Final Presentation - CPR E 492

Anthony Mazzie, Jeremiah Marchesani, Zachary Wingert, Ryan McNally, Grace Wigen, Timothy Ellis, Lucas Onwu-Chekwa

Introduction

- Client: **Reiman Gardens**
- Iowa Butterfly Survey Network
- **Users:** Trained volunteers and researchers

Android

iPhone

Browser

UBR

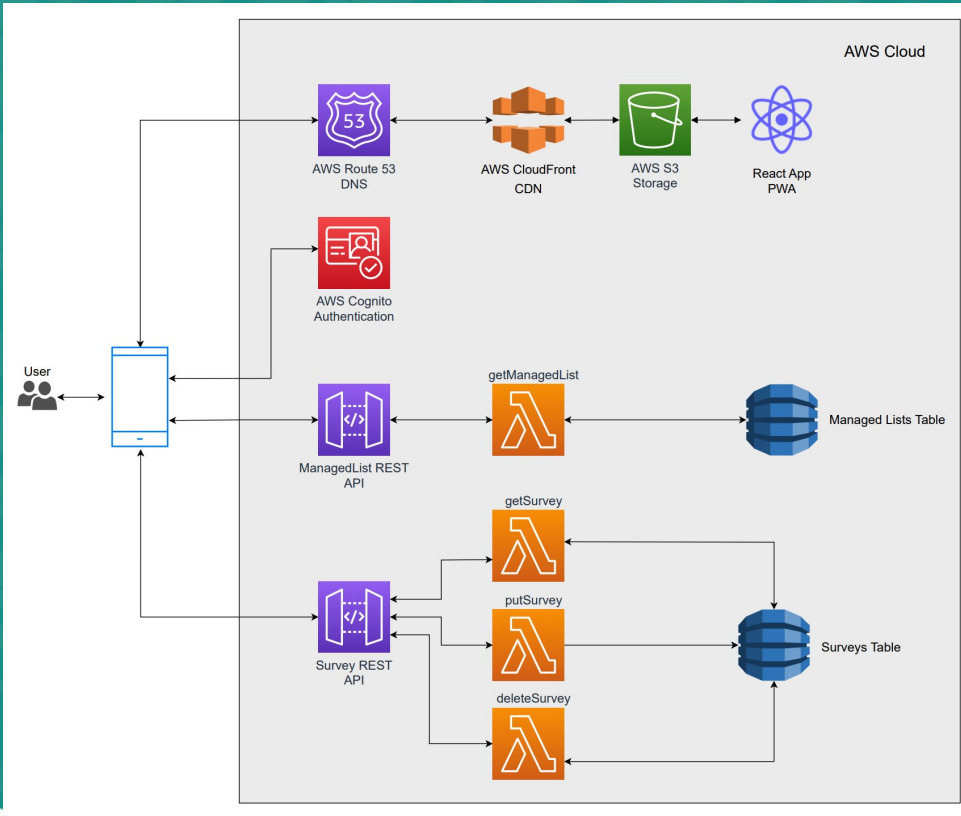

Objective

- Develop a new app that is:
 - A **Cross-Platform** application
 - **Maintainable** with longevity
 - **Faster** than pen & paper
 - Able to package data to the PollardBase **research standards**

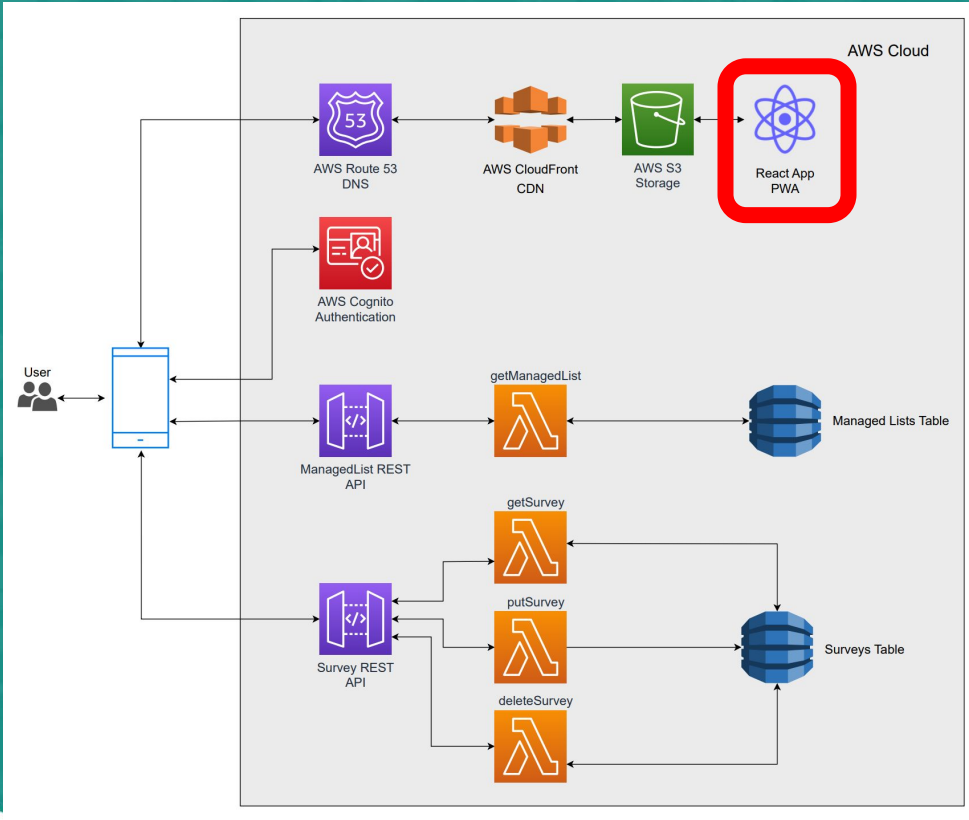

Implementation

- React Progressive Web Application (PWA) Frontend
- AWS Backend

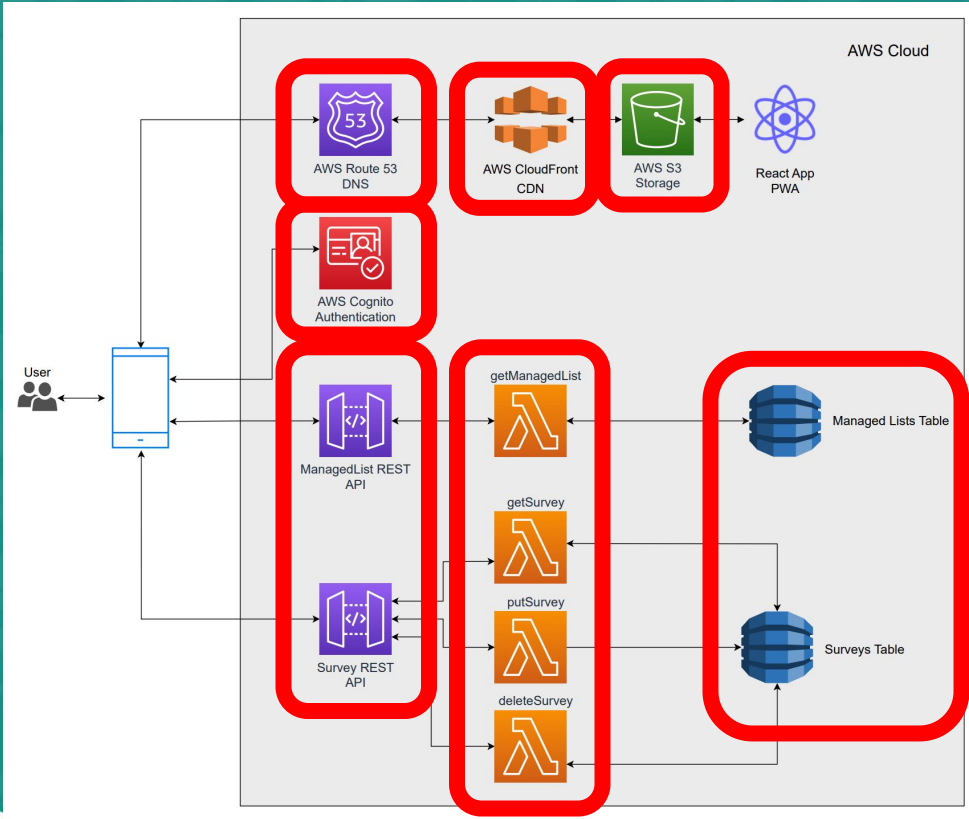

Implementation

- Frontend: React PWA
- IndexedDB for client-side storage
- Four contexts (State Mgmt)
 - Authorization
 - Settings
 - List
 - Survey

Implementation

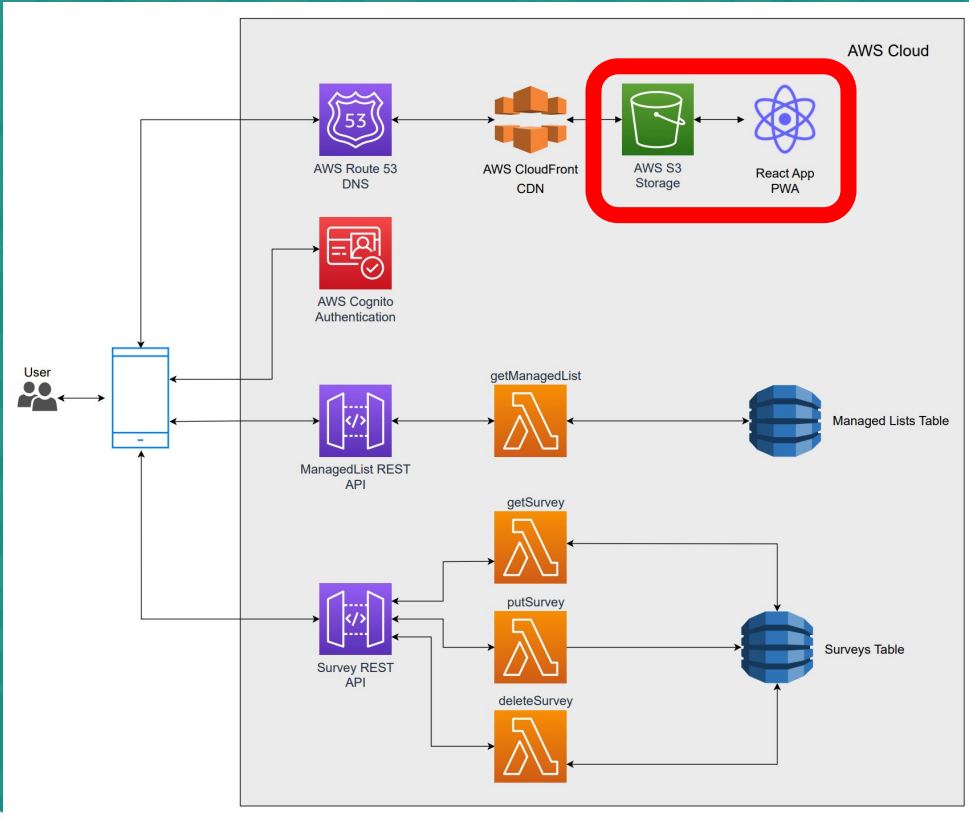

- AWS Backend:

- S3 (Storage)
- CloudFront (CDN)
- Route53 (DNS)
- Cognito (Authentication)
- API Gateway (API)
- Lambda (Compute)
- DynamoDB (Data store)

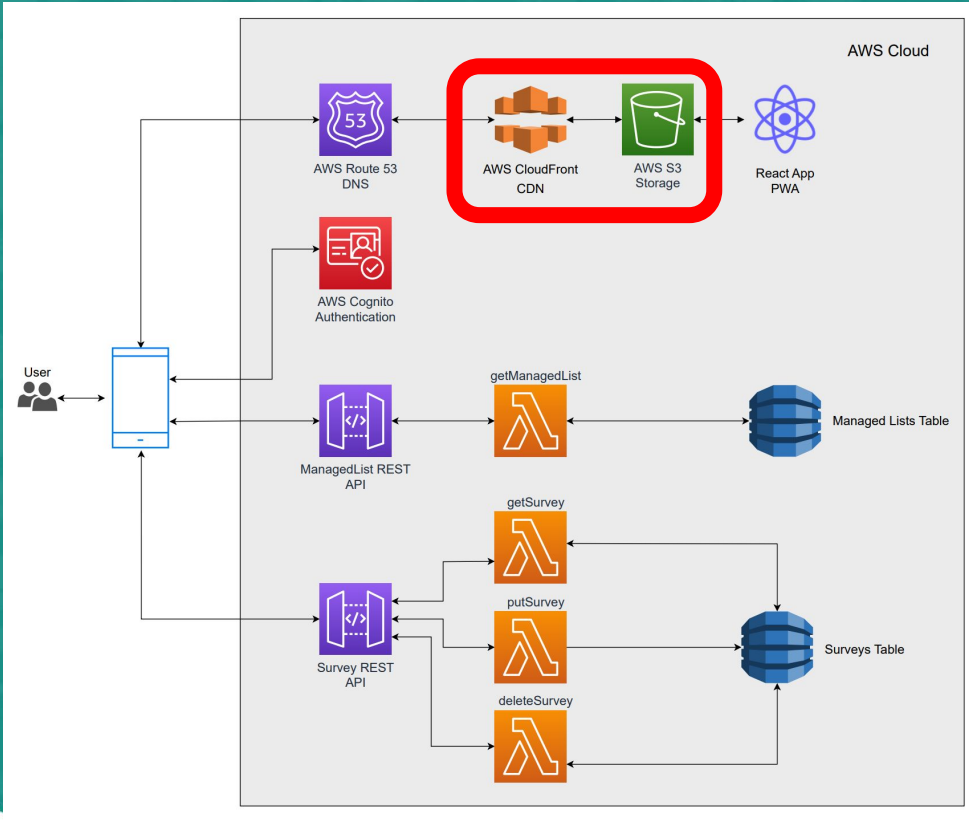

Implementation

- React PWA stored in an AWS S3 bucket

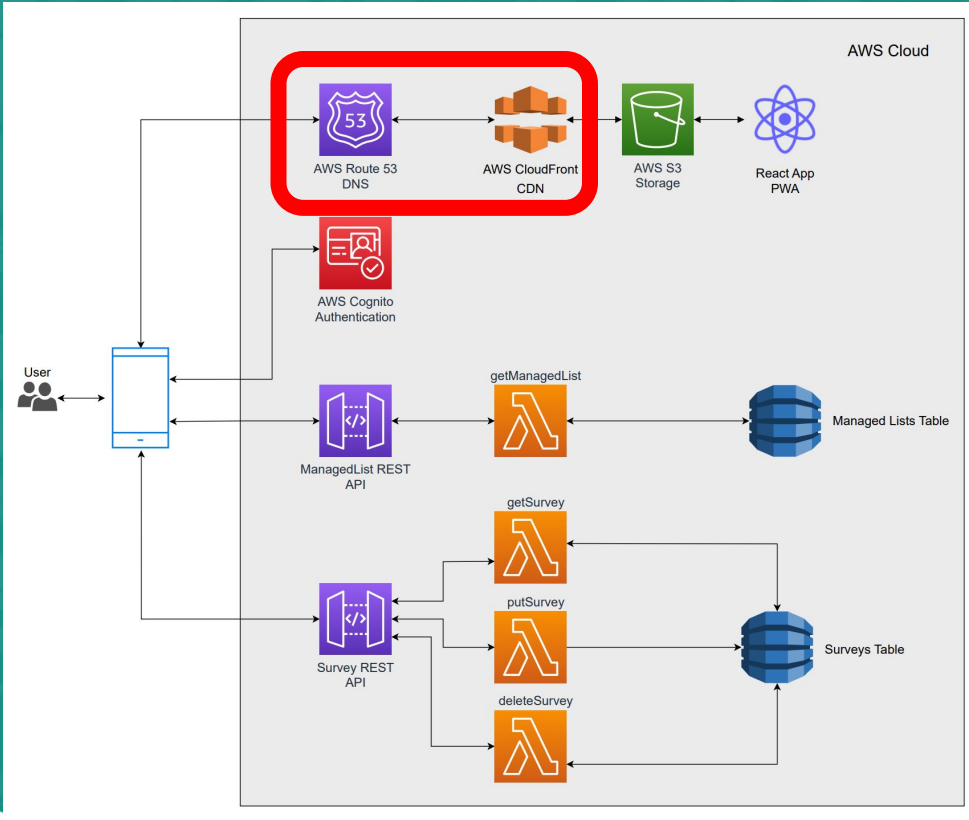

Implementation

- Contents of the S3 bucket shared to the AWS CloudFront Content Delivery Network

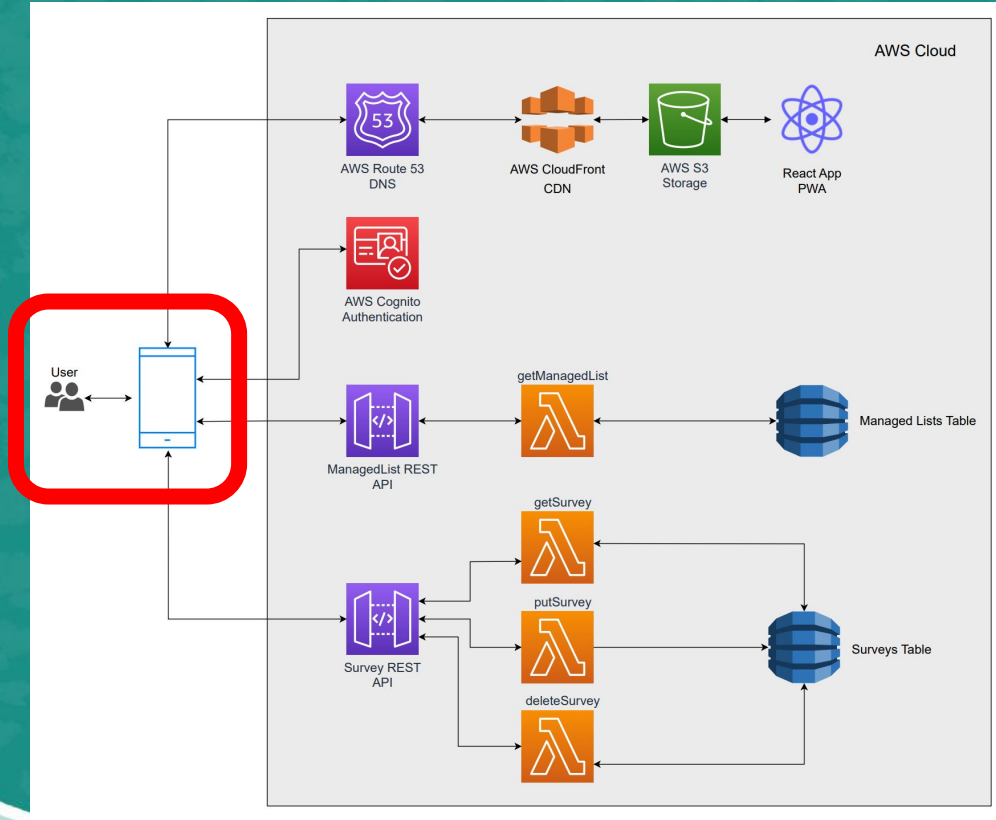

Implementation

- AWS Route 53 routes traffic directed to www.unifiedbutterflyrecorder.com to the CloudFront distribution

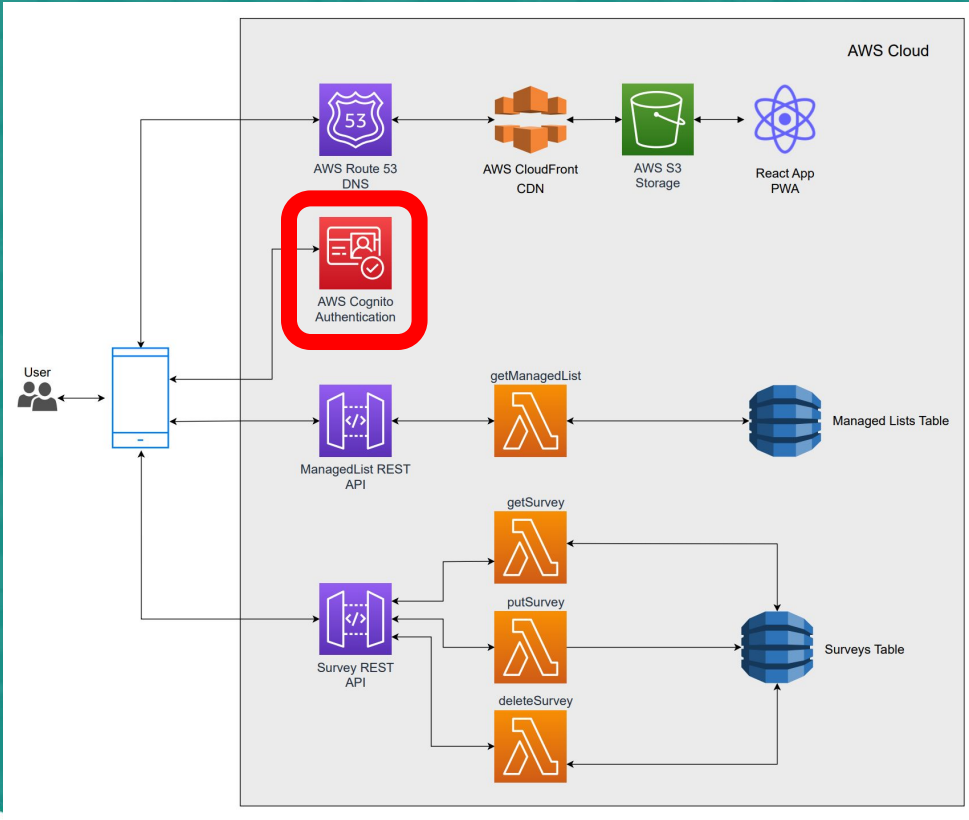

Implementation

- User accesses UBR using a mobile device and a web browser.
- Application can be installed to mobile device.

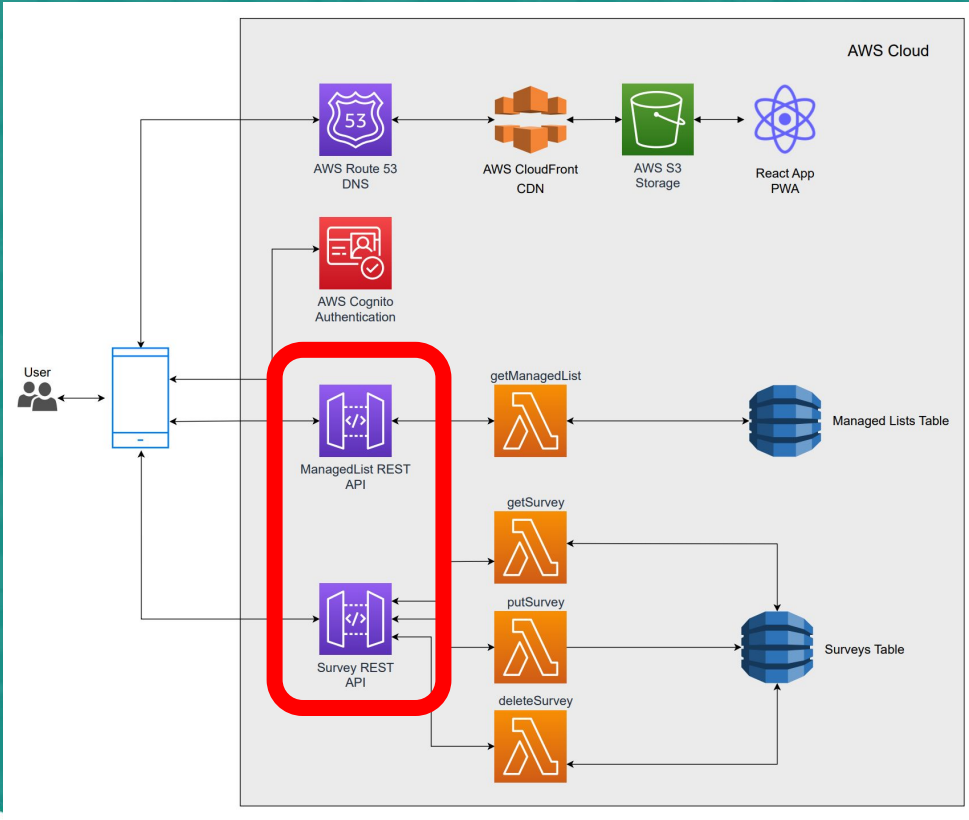

Implementation

- Upon reaching the application, the user must be authenticated.
- AWS Cognito provides authentication, authorization, and user management.

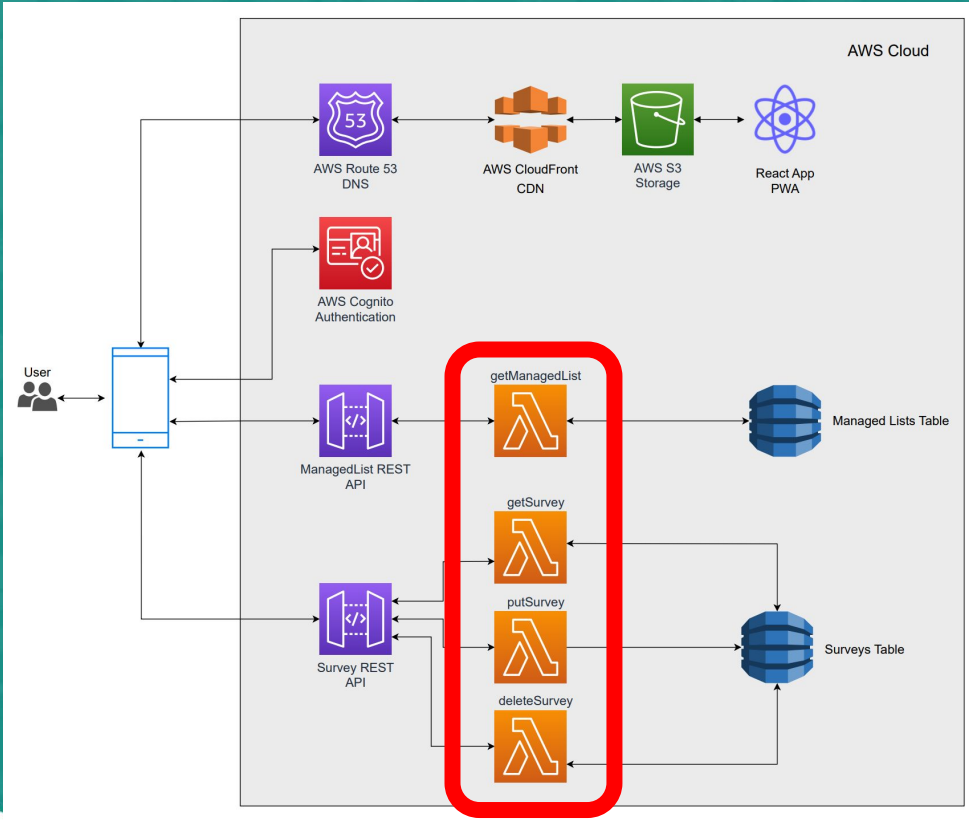

Implementation

- UBR has 2 REST API's between our front end and the backend:
 - Managed List (Butterfly lists)
 - Survey (User generated surveys)

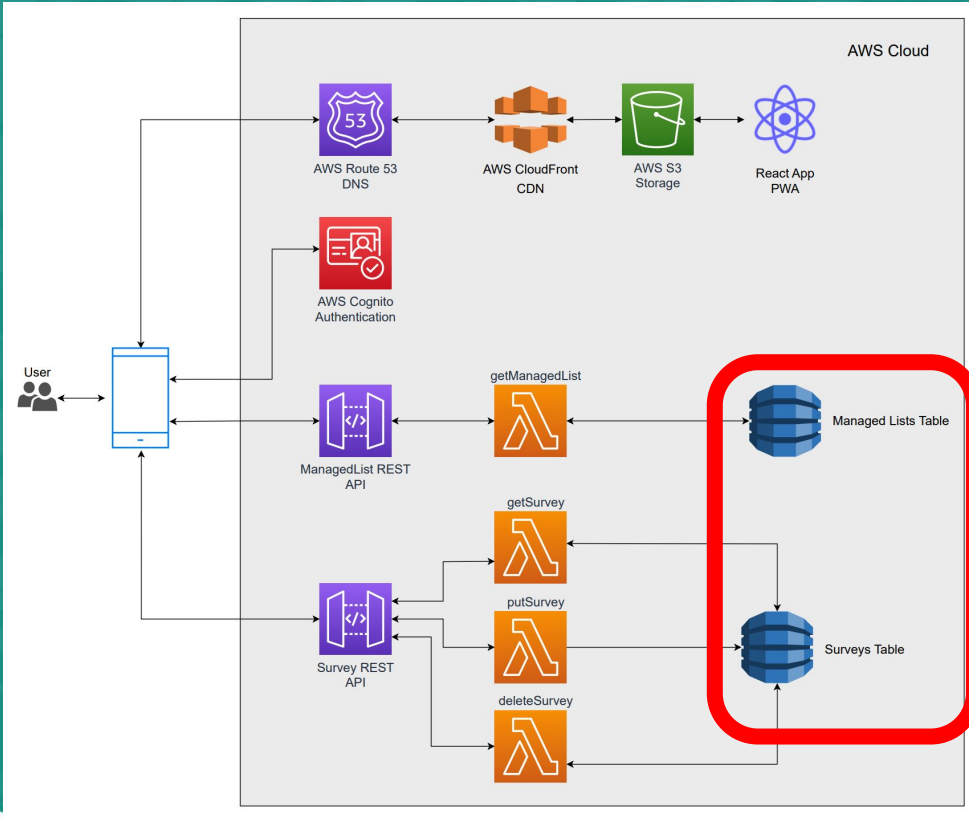

Implementation

- UBR has 4 Lambda functions to perform backend logic
- GET on the List table
- CRUD on the Survey table

Implementation

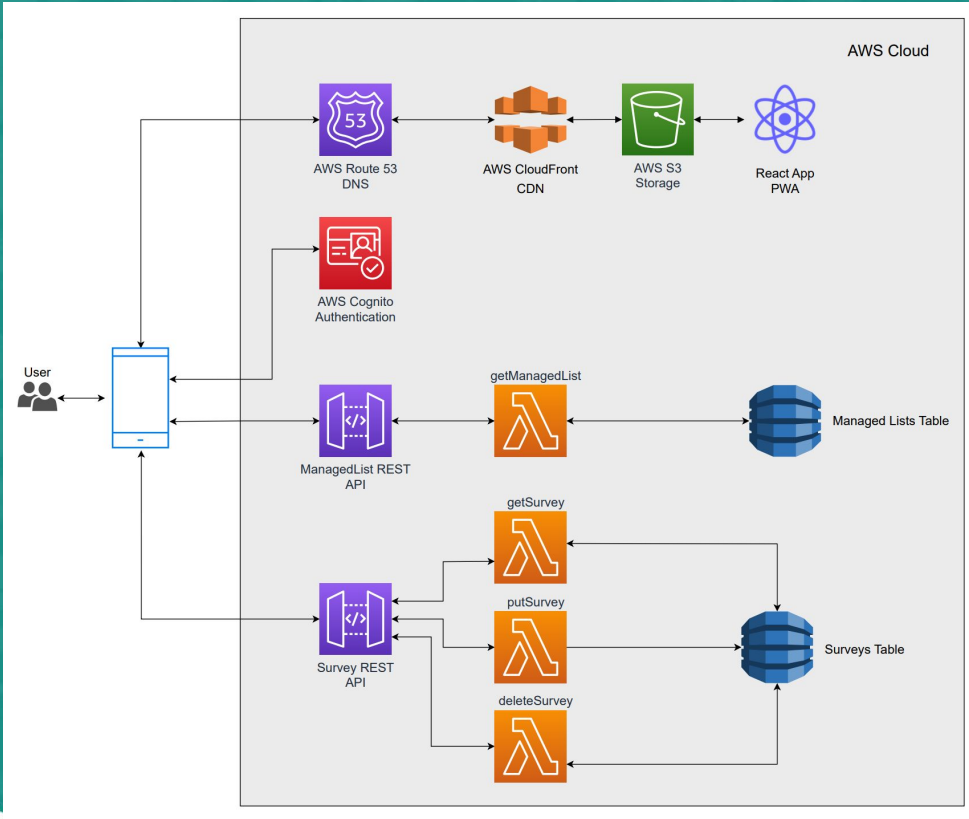

- UBR has 2 database tables
- Managed Lists
 - Reiman Gardens / client managed
- Survey
 - For all survey-related data

Implementation

Overview:

- All resources are serverless and event-driven, i.e. they only run when a user is actively using them
- Architecture is secure and scalable
- Built to be easy to maintain

General Use-Case

Before Survey:
Configure & Create
Survey

Mid-Survey:
Record Butterfly
Sightings

After Survey:
View & Download

Key Contributions

Timothy Ellis - Frontend

- Butterfly counter cards
- Family and subfamily organization
- Cancel and Finish dialogs
- Real time Timer
- Pause and continue survey

Lucas Onwu-Chekwa - Frontend

- Butterfly counter
- Edit survey (survey data and sighting details)
- Home page previous survey display
- Survey preview
- Active survey Search

Grace Wigen - Frontend

- Favourites system
- Butterfly list page
- Automatic butterfly color assignment

Zach Wingert - Frontend

- Maps
- Real time Weather api
- Pagination on homepage

Ryan McNally - Backend

- Survey Context/Persistent Data
- User Preferences
- Settings
- Local storage (default values)
- Incidental survey

Jeremy Marchesani - Frontend

- Active survey data flow
- Top nav bar
- Survey Context/Persistent Data

Anthony Mazzie - Backend

- AWS CDK Infrastructure as Code for:

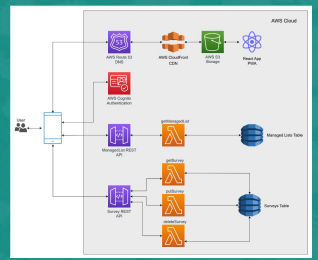

- Database
 - Api's
 - Lambda's
 - DNS
 - CDN
 - S3 Storage
 - Cognito Authentication
- CI/CD
- Survey data download to CSV
 - Frontend login/signup/forgot password

Testing

- User testing
- GitLab Pipeline for CI/CD
- AWS CDK tests

Challenges & Solutions

?

Challenges & Solutions

IndexedDB API

IndexedDB is a low-level API for client-side storage of significant amounts of structured data, including files/blobs. This API uses indexes to enable high-performance searches of this data. While [Web Storage](#) is useful for storing smaller amounts of data, it is less useful for storing larger amounts of structured data. IndexedDB provides a solution. This is the main landing page for MDN's IndexedDB coverage — here we provide links to the full API reference and usage guides, browser support details, and some explanation of key concepts.

Challenges & Solutions

IDB-Keyval

npm v6.2.0

This is a super-simple promise-based keyval store implemented with IndexedDB, originally based on [async-storage by Mozilla](#).

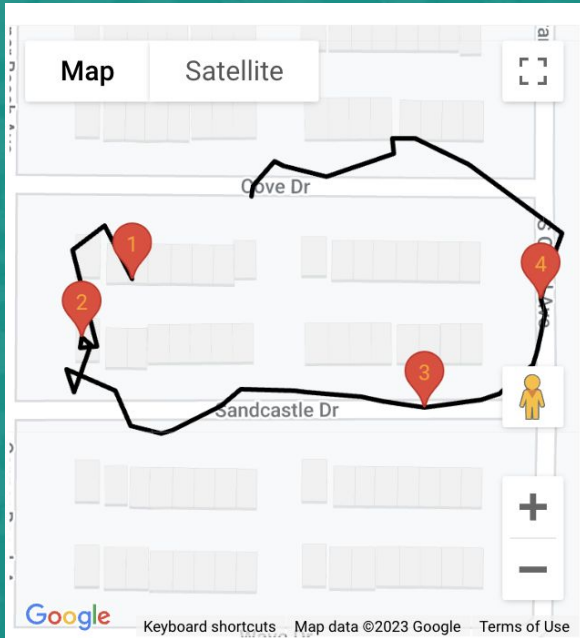

It's small and tree-shakeable. If you only use get/set, the library is ~250 bytes (brotli'd), if you use all methods it's ~534 bytes.

[localForage](#) offers similar functionality, but supports older browsers with broken/absent IDB implementations. Because of that, it's orders of magnitude bigger (~7k).

This is only a keyval store. If you need to do more complex things like iteration & indexing, check out [IDB on NPM](#) (a little heavier at 1k). The first example in its README is how to create a keyval store.

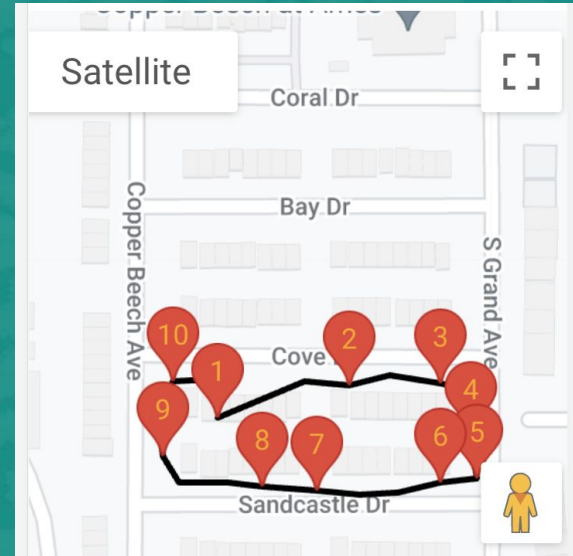

Challenges & Solutions

After optimization >

Challenges & Solutions

PollardBase

Future Work

- PollardBase integration
- Pictures
- User Custom Lists

Conclusion

- We learned so much from this project
 - Interacting with a client
 - Managing a product
- UBR will be used across the United States
- We are super proud of the product we have come up with
